FREE · 30 MINUTES · VIDEO CALL

Process Check

For small businesses where someone still copies documents or data by hand. In 30 minutes we find the one process that costs you the most hours, and you get a written answer on what fixing it would save and cost.

The offer

A free 30-minute call. You show me how one piece of work moves through your business today: an email arrives, someone opens the attachment, types the details into a spreadsheet or tool, and passes it on. I ask questions, count the minutes, and look at where a computer could do the copying.

No sales pitch on the call and no obligation afterwards. You keep the written result whether or not we work together.

Who it is for

- Small service businesses: recruiting, agencies, practices, trades, shops, associations.
- Someone on your team spends hours a week moving data from emails, PDFs or forms into sheets or other tools.
- The same information gets typed twice, and copy-paste errors cost you time or customers.
- You want it fixed once, not another subscription to learn.

What you get: a one-page written result

1 · THE PROCESS
What happens today
Step by step, who does it and how often.

2 · HOURS SAVED
Per week, with the math
The hours the fix takes off your team, and what that is worth in a year.

3 · THE FIX
What gets automated
Which tools, what runs by itself, and what stays with a person.

4 · FIXED PRICE
Automation Sprint
One process automated in 14 days at a fixed price. Optional monthly maintenance.

The Automation Sprint

If you want the fix, I build it in a 14-day sprint for the fixed price on your result page. You see it working on your own documents before you accept it. If it does not run as agreed after acceptance, I keep working on it at no extra cost until it does. After that, an optional maintenance retainer keeps it running when your forms, tools or inboxes change.

Who I am

Artin Lenz, software developer in Berlin. At work I maintain a large C++ codebase and PowerShell automation. On my own projects I build tools in TypeScript, Python, Swift and Rust.
